

# Tectonics Research Project

We know that the movement of the plates beneath the earth's crust can cause earthquakes and volcanoes. But how have these movements affected the lives of people within the last **three months**?

For this task, you need to research any **one** earthquake or volcano that has occurred recently and write a report that explains exactly what happened. Use the checklist below to help you.

Where did the tectonic event take place?	<input type="checkbox"/>
What processes caused it?	<input type="checkbox"/>
Exactly what happened and how long did it last?	<input type="checkbox"/>
Describe the impacts on people who live there.	<input type="checkbox"/>
What are the impacts on the environment nearby?	<input type="checkbox"/>
How severe were the economic impacts?	<input type="checkbox"/>
Will this event have impacts that last into the future?	<input type="checkbox"/>

## Tips:

- Use the Internet to help you with your research.
- Try searching on websites such as BBC News.
- Do not limit your search to just one website.
- Do not copy and paste information you find.
- Include pictures of the event in your report.
