

Handpicking

Handpicking is a separating used by most indigenous people, the concept of handpicking is very simple. It is just one person picking out a different substance from mixtures of two or more things.

This type of separation can be separate mainly solid particle as it is impossible to handpick a liquid or a gas. The mixture that is going to be separated also needs a noticeable difference between the two substance. It can either be different colour, texture, or size.

Handpicking is so simple yet so effective, all you need to do is separate the substance that you want to keep in another container or a place that it will not mix the mixture back together

Handpicking is by far the most simple and obvious ways to separate. It does not require any equipment, unlike the other separation techniques, your hands are the only thing you need. Handpicking is similar to filtering, sieving and winnowing as these techniques all separate solid substance. But it is totally different than steam distilling and cold pressing
